

Team 12 transaction-risk policy

Business reference guide | Policy version 2.1.0 | 30 July 2026

This guide explains how the platform prioritises transaction review. It combines transparent compliance rules with an SAP AI Core behavioural-anomaly signal. It is designed for prioritisation and explainability, not automatic final disposition.

How the final score is calculated

The system adds applicable rule points into a rule score (capped at 100). When the anomaly model is available, the final score combines the two signals as shown below. A sanctions hard override always takes precedence.

$$\text{Final score} = (\text{Rule score} \times 80\%) + (\text{Behavioural anomaly score} \times 20\%)$$

Rule points are fixed contributions, not percentages. Points are additive except within an exclusive group, where only the highest applicable rule is counted. If the model is unavailable, the rule score is still returned and the response states MODEL_UNAVAILABLE.

Risk bands and actions

Final score	Risk level	Recommended action
85-100	Critical	Hold and escalate
65-84	High	Priority review
35-64	Medium	Standard review
0-34	Low	Monitor

Hard overrides

These controls override the normal weighted calculation.

Condition	Minimum final score	Required outcome
Confirmed sanctions match for a transaction party	100	Critical; hold and escalate
Confirmed sanctions match for a beneficial owner	100	Critical; hold and escalate
Destination country is subject to sanctions	95	Critical; hold and escalate

Rule catalogue

Geography and KYC: only the highest applicable rule in each group is counted.

Rule	Trigger	Points
FATF black list	Destination is on the FATF black list	30
FATF non-compliant	Destination is FATF non-compliant	25
FATF grey list	Destination is on the FATF grey list	15
KYC rejected	Customer KYC status is rejected	30
KYC expired	KYC was expired at the transaction time	15
KYC pending	Customer KYC status is pending	10

Customer and adverse-information context

Rule	Trigger	Points
PEP exposure	Company or beneficial owner is PEP-associated	20
High-risk industry	Industry has high inherent AML risk or sensitivity	5
Adverse media	Adverse-media flag is present	10

Transaction behaviour

Only the highest applicable amount-deviation and daily-value rule is counted.

Rule	Trigger	Points
Extreme amount deviation	Payment is at least 10x the customer's prior norm	30
High amount deviation	Payment is at least 5x the customer's prior norm	20
Elevated amount deviation	Payment is at least 3x the customer's prior norm	10
Extreme daily value	Trailing 24-hour value is at least 50x the prior norm	25
High daily value	Trailing 24-hour value is at least 30x the prior norm	15
Structuring pattern	Near-threshold payments collectively exceed the threshold	25
New high-risk country	First payment to a high-risk destination country	15
New counterparty, large payment	First payment to counterparty and payment is at least 3x normal	10
Unusual time	Payment occurred outside 06:00-22:00 UTC	5
High-value round amount	At least USD 10,000 and a round thousand amount	10

Reserved control

Rule	Trigger	Points	Current status
Rapid movement	Funds moved onward unusually quickly	20	Defined in policy but not yet activated; the current data flow does not calculate onward-fund movement reliably.

Why the model and rules are kept separate

The model identifies behavioural deviation against the same company's earlier activity: amount, frequency, counterparties, destinations and timing. Rules cover deterministic compliance and context signals such as KYC, PEP, FATF, sanctions and adverse media. A low behavioural-anomaly score can never hide a sanctions outcome.

Illustrative API response

Example calculation: a rule score of 85 and model score of 75 produces a final score of 83: $(85 \times 0.80) + (75 \times 0.20) = 83$. This maps to HIGH / PRIORITY_REVIEW. The accompanying JSON file is illustrative and contains no customer data.

Business interpretation: the score prioritises review. The triggered-rule list and model explanation show why the transaction was prioritised.
